The following BASIC code generates 10,000 values of a random variable $X$ and calculates the sample average, the sample variance, and the fraction of sample values that lie in the interval ( $a, b$ ]. Adapt this simulation program (you may use BASIC or any other language) to:

1. Calculate the values needed to fill in the table for $E(X), V(X)$ and $P(a<X \leq b)$, where $a$ and $b$ are specified in Homework 0. Show all theoretical calculations.
2. For each case, on a separate page, draw the graph of the theoretical distribution function $F_{x}(t)$, fill in the table describing $F_{x}(t)$, and plot the simulation values given in the table on the same graph as the theoretical distribution function.
```
100 FOR i = 1 TO 10000
generate X
200 S1 = S1 + X
300 S2 = S2 + X^2
4 0 0 ~ I F ~ ( X ~ > ~ a ) ~ A N D ~ ( X ~ < = ~ b ) ~ T H E N ~ c ~ = ~ c ~ + ~ 1 ~
500 NEXT i
600 PRINT S1/10000, S2/10000 -(S1/10000)^2, c/10000
```
