Google Maps Project

The objective of this project is to build a replacement for the FAU Campus Maps web page at

http://www.fau.edu/about/campuses/campusmaps.html

using a Google Maplet. Include an overview map that identifies the locations of the campuses and the ability to get more detailed maps. Also provide the users the ability to get directions to a campus by specifying a starting location. Include the ability to link the campus detail pages (click a star or small map on the current page.) Also allow users to get directions to a selected campus by specifying a starting location. You can find additional information that may be useful on the Campuses web page at

http://www.fau.edu/explore/campuses.php

It is sufficient for the project to provide the full detail for only one campus.

The XHTML for the project must pass the validation test. Post the project to the web and submit the url where it can be viewed by email.

Alternatives:

- You may choose a different subject for your map as long as you provide similar services. Submit a proposal for confirmation.
- You can use Microsoft Virtual Earth SDK available at

  http://dev.live.com/virtualearth/
