Announcement
3/22/11

1. All PHP examples from Chapter 23 of your textbook are available online. They can be accessed via the following format:

   http://lamp.cse.fau.edu/~samh/php/*programName*

   e.g.,
   http://lamp.cse.fau.edu/~samh/php/arrays.php

2. A directory named **public_html** has been created in your home directory on the student server, **lamp.cse.fau.edu**. The apache server on lamp will search for your PHP files starting from this directory. For example, if you have a file named **try.php** under a subdirectory named **php** in this directory, it can be accessed via:

   http://lamp.cse.fau.edu/~*yourLoginID***/php/try.php**

3. You need to pay attention to the directory and file permissions in your **public_html** directory. All subdirectories should have 755 permission, whereas files should have 644 permission. You may issue the following commands to change permissions:

   chmod 755 *directoryName(s)*
   chmod 644 *fileName(s)*

   Note: To protect your home directory, you may issue the following command in your home directory to prevent unauthorized accesses to you files in the directory:

   chmod 711 $HOME
